Brick ports

lego.bricks · the contract between a component and a document

Declaration

```
brick('viz.funnel', 'Funnel', 'viz',
      ports=[Port('stages', 'list', '[{name, value}]', sample=[...])],
      emits=[Port('stages', 'list', 'The stages after a drag')],
      height=330)
```

The four messages

message	direction	meaning
`brick:ready`	frame to host	loaded, with its manifest
`brick:props`	host to frame	resolved port values
`brick:height`	frame to host	how tall it wants to be
`brick:emit`	frame to host	a value the person produced by using it

Wiring

A package ships its wiring twice: as an import of the package, and as a call to the host that owns it. The document runs the first and falls back to the second when the import fails.

Routes

route	serves
`/bricks/manifest.json`	every brick, its ports, its emits
`/bricks/f/<name>`	one brick as a whole page
`/bricks/data/<name>`	its ports, filled by the package
`/bricks/wire/<name>`	the wiring, both forms
